

### **Should angiotensin-converting enzyme inhibitors (ACE-I) be used for diabetic patients with hypertension only if there is also proteinuria?**

Current guidelines for the treatment of hypertension in patients with diabetes with or without microalbuminuria (excretion of 30 mg to < 300 mg/24 hours albumin in the urine<sup>1</sup>) or macroalbuminuria (excretion of >300 mg/24 hours albumin in the urine<sup>1</sup>) were reviewed. Guidelines were included from the American Diabetes Association (ADA), American Association of Clinical Endocrinologists and American College of Endocrinology (AACE/ACE), Eighth Joint National Committee (JNC8), and the National Kidney Foundation. See the table below for selected relevant recommendations from these guidelines. The cited guidelines were published between 2007 and 2016, with the guidelines from the ADA being most recent. In summary:

- Recommendations from ADA<sup>2</sup> and AACE/ACE<sup>3</sup> state that initial pharmacological therapy for hypertension in patients with diabetes should include either an ACE-I or an angiotensin II receptor blocker (ARB). These recommendations did not include any reference to the presence or absence of microalbuminuria, macroalbuminuria, or proteinuria.
- The JNC8<sup>4</sup> included ACE-Is or ARBs for initial treatment for nonblack people with diabetes, but also included thiazide diuretics or calcium channel blockers (CCB) as other options. In the general black population, initial treatment should include a thiazide diuretic or a CCB. If a patient has chronic kidney disease (CKD), with or without diabetes, an ACE-I or ARB should be used.
- Recommendations from the National Kidney Foundation were included in 3 different publications.<sup>1,5,6</sup> (See Table). By definition, these guidelines cover those patients who have CKD, although these patients do not necessarily have microalbuminuria. Recommendations for specific antihypertensive medications were not provided for patients with CKD and urine albumin excretions of <30 mg/24 hour period.

It is apparent from this review that various recommendations exist for the initial treatment of hypertension in patients with diabetes without micro- or macro-albuminuria. The guidelines from the ADA and AACE/ACE are the most recent of those reviewed, and both of these guidelines include recommendations for ACE-Is or ARBs for treatment of hypertension. JNC8 includes an ACE-I or ARB as an option for initial treatment for nonblack patients, but not for black patients. Guidelines from the National Kidney Foundation include recommendations only for patients with CKD.

Guideline	Selected Recommendations / Comments																										
Guidelines from Diabetes Organizations																											
American Diabetes Association. <sup>2</sup>	<ul style="list-style-type: none"> <li>• Treatment regimens for patients with both DM and HTN should include either an ACE-I or an ARB, but not both. If one class is not tolerated, the other should be tried.</li> <li>• An ACE-I or ARB is recommended for the treatment of patients (nonpregnant) with DM and albuminuria of 30-299 mg/day and is strongly recommended for patients with albuminuria of <math>\geq 300</math> mg/day and/or eGFR <math>&lt; 60</math> mL/min/1.73 m<sup>2</sup>.</li> <li>• An ACE-I or an ARB is not recommended for the primary prevention of DKD in patients with DM who have normal BP, normal urinary albumin-to-creatinine ratio (<math>&lt; 30</math> mg/g), and normal eGFR.</li> </ul>																										
Handelsman et al. <sup>3</sup>	<ul style="list-style-type: none"> <li>• ACE-I or ARBS are preferred for the treatment of HTN in patients with DM.</li> </ul> <table border="1" data-bbox="394 738 1102 1242"> <caption data-bbox="485 748 1018 792">Table 13 Suggested Priority of Initiating Blood Pressure-Lowering Agents</caption> <thead> <tr> <th data-bbox="394 797 766 857">Therapy</th> <th data-bbox="772 797 1102 857">Reference (evidence level and study design)</th> </tr> </thead> <tbody> <tr> <td colspan="2" data-bbox="394 862 1102 889">Evidence based</td> </tr> <tr> <td data-bbox="394 894 766 922">RAAS blockers (ACE inhibitor or ARB)</td> <td data-bbox="772 894 1102 922">(198 [EL 1; RCT]; 199 [EL 1; RCT])</td> </tr> <tr> <td data-bbox="394 927 766 954">Thiazide diuretic</td> <td data-bbox="772 927 1102 954">(194 [EL 4; review NE])</td> </tr> <tr> <td data-bbox="394 959 766 987"><math>\beta</math>-Adrenergic blocker</td> <td data-bbox="772 959 1102 987">(199 [EL 1; RCT])</td> </tr> <tr> <td colspan="2" data-bbox="394 992 1102 1019">Individualized therapy</td> </tr> <tr> <td data-bbox="394 1024 766 1052">Calcium channel blockers</td> <td data-bbox="772 1024 1102 1052">(214 [EL 1; RCT, posthoc analysis])</td> </tr> <tr> <td data-bbox="394 1057 766 1084">Aldosterone receptor blockers</td> <td data-bbox="772 1057 1102 1084">(202 [EL 4; CPG NE])</td> </tr> <tr> <td data-bbox="394 1089 766 1117">Direct renin inhibitor</td> <td data-bbox="772 1089 1102 1117"></td> </tr> <tr> <td data-bbox="394 1122 766 1149">Selective <math>\alpha_1</math>-adrenergic blockers</td> <td data-bbox="772 1122 1102 1149"></td> </tr> <tr> <td data-bbox="394 1154 766 1182">Central <math>\alpha_2</math> agonists</td> <td data-bbox="772 1154 1102 1182"></td> </tr> <tr> <td data-bbox="394 1187 766 1214">Direct vasodilators</td> <td data-bbox="772 1187 1102 1214"></td> </tr> <tr> <td colspan="2" data-bbox="394 1219 1102 1242">Abbreviations: ACE = angiotensin-converting enzyme; ARB = angiotensin II receptor blocker; RAAS = renin-angiotensin-aldosterone system.</td> </tr> </tbody> </table> <p data-bbox="394 1252 472 1279">[pg 34]</p>	Therapy	Reference (evidence level and study design)	Evidence based		RAAS blockers (ACE inhibitor or ARB)	(198 [EL 1; RCT]; 199 [EL 1; RCT])	Thiazide diuretic	(194 [EL 4; review NE])	$\beta$ -Adrenergic blocker	(199 [EL 1; RCT])	Individualized therapy		Calcium channel blockers	(214 [EL 1; RCT, posthoc analysis])	Aldosterone receptor blockers	(202 [EL 4; CPG NE])	Direct renin inhibitor		Selective $\alpha_1$ -adrenergic blockers		Central $\alpha_2$ agonists		Direct vasodilators		Abbreviations: ACE = angiotensin-converting enzyme; ARB = angiotensin II receptor blocker; RAAS = renin-angiotensin-aldosterone system.	
Therapy	Reference (evidence level and study design)																										
Evidence based																											
RAAS blockers (ACE inhibitor or ARB)	(198 [EL 1; RCT]; 199 [EL 1; RCT])																										
Thiazide diuretic	(194 [EL 4; review NE])																										
$\beta$ -Adrenergic blocker	(199 [EL 1; RCT])																										
Individualized therapy																											
Calcium channel blockers	(214 [EL 1; RCT, posthoc analysis])																										
Aldosterone receptor blockers	(202 [EL 4; CPG NE])																										
Direct renin inhibitor																											
Selective $\alpha_1$ -adrenergic blockers																											
Central $\alpha_2$ agonists																											
Direct vasodilators																											
Abbreviations: ACE = angiotensin-converting enzyme; ARB = angiotensin II receptor blocker; RAAS = renin-angiotensin-aldosterone system.																											

Guidelines from JNC8	
James et al. <sup>4</sup>	<ul style="list-style-type: none"> <li>• In the general nonblack population, including those with DM, initial treatment for HTN should include a thiazide-type diuretic, CCB, ACE-I, or ARB.</li> <li>• In the general black population, including those with DM, initial treatment for HTN should include a thiazide-type diuretic or CCB.</li> <li>• In the population ≥18 years of age with CKD and hypertension, initial (or add-on) treatment for HTN should include an ACE-I or ARB to improve kidney outcomes. This applies to all patients with CKD and HTN regardless of race or DM status.</li> </ul>
Guidelines from the National Kidney Foundation	
National Kidney Foundation <sup>1</sup> 2007	<ul style="list-style-type: none"> <li>• Patients with DM and CKD stages 1-4 who have HTN should be treated with an ACE-I or an ARB, usually along with a diuretic. The target BP in DM and CKD stages 1-4 should be &lt; 130/80 mm Hg.</li> </ul>
National Kidney Foundation <sup>5</sup> 2012	<ul style="list-style-type: none"> <li>• It is recommended not to use an ACE-I or ARB for the primary prevention of DKD in patients with DM who do not have HTN or albuminuria.</li> <li>• It is suggested that an ACE-I or an ARB be used in normotensive patients with DM and albuminuria levels &gt; 30 mg/g who are at high risk of DKD or its progression.</li> </ul>
Kidney Disease: Improving Global Outcomes (KDIGO) Blood Pressure Work Group <sup>6</sup> 2012	<p>“Chapter 4: BP management in CKD ND patients with DM</p> <p>4.1: We recommend that adults with DM and CKD ND with urine albumin excretion &lt;30 mg per 24 hours (or equivalent*) whose office BP is consistently &gt;140 mm Hg systolic or &gt;90 mm Hg diastolic be treated with BP-lowering drugs to maintain a BP that is consistently ≤140 mm Hg systolic and ≤90 mm Hg diastolic. (1B)</p> <p>4.2: We suggest that adults with DM and CKD ND with urine albumin excretion &gt;30 mg per 24 hours (or equivalent*) whose office BP is consistently &gt;130 mm Hg systolic or &gt;80 mm Hg diastolic be treated with BP-lowering drugs to maintain a BP that is consistently ≤130 mm Hg systolic and ≤80 mm Hg diastolic. (2D)</p> <p>4.3: We suggest that an ARB or ACE-I be used in adults with DM and CKD ND with urine albumin excretion of 30 to 300 mg per 24 hours (or equivalent*). (2D)</p> <p>4.4: We recommend that an ARB or ACE-I be used in adults with DM and CKD ND with urine albumin excretion &gt;300 mg per 24 hours (or equivalent*). (1B)</p> <p>*Approximate equivalents for albumin excretion rate per 24 hours—expressed as protein excretion rate per 24 hours, albumin/creatinine ratio, protein/creatinine ratio, and protein reagent strip results—are given in Table 1, Chapter 1.” [pg 342]</p> <p>“Recommendation 4.1 applies to diabetic patients with CKD, defined as a GFR &lt;60 ml/min/1.73 m<sup>2</sup>, and normal albumin excretion (normoalbuminuria) prior to the use of BP-lowering drugs such as ACE-Is or ARBs. ...” [pg 364]</p>

ACE-I = angiotensin-converting enzyme inhibitor; ARB = angiotensin receptor blocker; BP = blood pressure; CCB = calcium channel blocker; CKD = chronic kidney disease; CKD ND = non-dialysis-dependent CKD of any stage; DKD = diabetic kidney disease; DM = diabetes mellitus; EL = evidence level; eGFR = estimated glomerular filtration rate; GFR = glomerular filtration rate; RAAS = renin-angiotensin-aldosterone system; RCT = randomized controlled trial
